Names: Alec Yu, Dillon ODonnell

About:
To compile the program, call:
        make
In the command line, and to run the tests, call:
        make test

The tests will run and compare allTokens.in with allTokens.out, testTokens.out with empty.out, badTokens.out with badTokensExp.out, and comment.out with empty.out. These test use the 'diff' command, so the tests pass if 'diff' returns nothing, showing that the files are matching. If a failed test happens, the 'diff' command will show differences in the files, and testTokens.out will have a description of the failed tests.

To clean out the directory of compiled files and test outputs, use:
        make clean
        make cleantest
